

Full Stack Development

Meghana

WHAT IS FULL STACK DEVELOPMENT ??

Full Stack Development refers to the development of both front end (client side) and back end (server side) portions of web applications.

Full Stack web developers have the ability to design complete web applications and websites.

WHAT IS FRONT-END DEVELOPMENT??

It is the visible part of website or web application which is responsible for user experience. The user directly interacts with the front end portion of the web application or website.

Front-end Technologies

- HTML • CSS • JavaScript

CSS Frameworks

- Bootstrap Tailwind CSS

JavaScript Libraries

- React.js

JavaScript Frameworks

- Angular Vue.js

WHAT IS BACK-END DEVELOPMENT??

Backend Development is the process of building and maintaining the invisible engine of a website or app — the part that stores data, processes requests, and makes the front-end actually work by connecting it to databases, servers, and APIs.

BACKEND TECHNOLOGIES :

- Core Python Technologies
- Python Frameworks : Flask, Django.
- Database & Persistence : Mysql
- API & Web Technologies : REST API

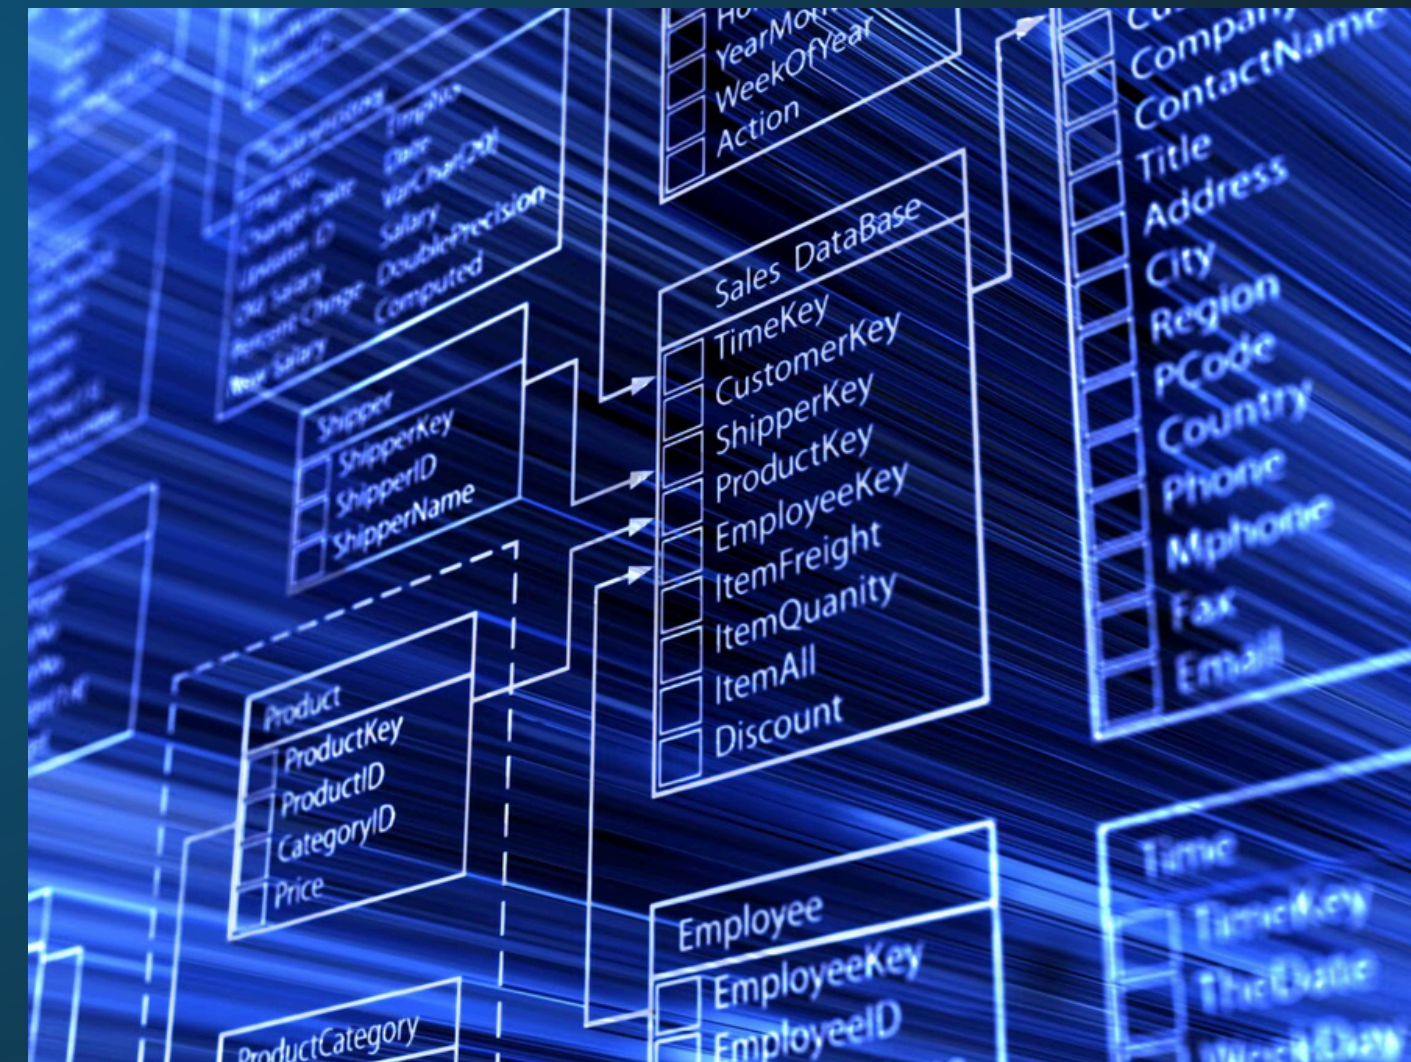

WHAT IS DATABASE??

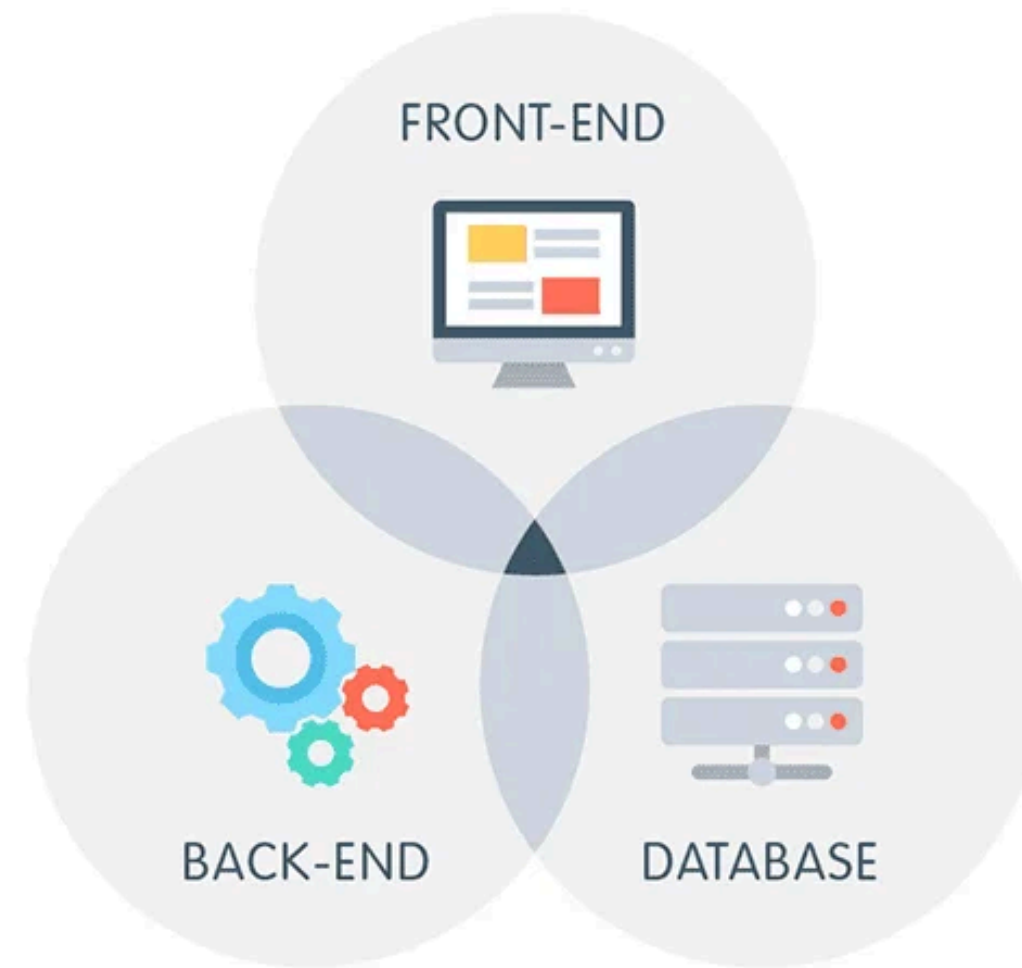

A database in full stack development is a system used to store, organize, and manage application data so that the backend can save, retrieve, update, and delete information whenever needed.

Why Database is Needed

- To store application data safely
- To retrieve data quickly whenever required
- To update data without losing previous information
- To manage large amounts of data efficiently

FULL-STACK DEVELOPMENT

The Role of a Full Stack Developer

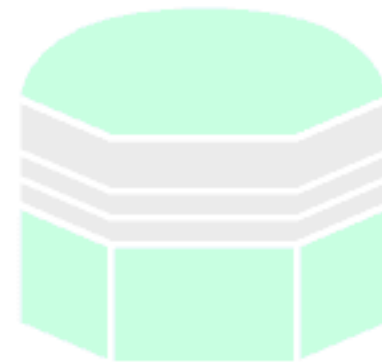

Front-End Development

Involves user interface design and interactivity

Essential Skills

Includes databases, version control, and cloud services

Back-End Development

Manages data exchange and application logic

THANK YOU
